

PROBLEM SESSION: Virtual Memory.

1. Understand the concept of virtual memory
 - 1) Explain and compare how virtual memory is implemented in modern Linux and MS Windows?
 - 2) Show step-by-step how to increase or decrease swap space in Linux (with screenshots).
2. Understand the Linux VM Monitoring
 - 1) Run “free” command in the Linux shell
 - 2) Capture the output and explain everything that is shown by this command
 - 3) Summarize all numerical values shown by this command into a paragraph.
 - 4) Use “free --help” and select 2 useful arguments of the free command (could be combination of multiple arguments if it is interesting). For each argument:
 - Describe what it does.
 - Show a sample command and explain the output.
 - 5) if you do not have “vmstat”, install and run it in the Linux shell.
 - 6) Capture the output and explain everything that is shown by this command
 - 7) Summarize all numerical values shown by this command into a paragraph.
 - 8) Use “vmstat --help” and select 2 useful arguments of the vmstat command (could be combination of multiple arguments if it is interesting). For each argument:
 - Describe what it does.
 - Show a sample command and explain the output.

Note: please capture the output image from running the command for both “free” and “vmstat”.
3. Understand Windows VM Monitoring
 - 1) Open “Resource Monitor” or use command “resmon” in PowerShell
 - 2) Capture the output and explain the information shown on the interface related to memory monitoring.
 - 3) Summarize all numerical values shown in “physical memory” tab into a paragraph.

Submission

Submit the report containing all the answer for each instruction into LEB2 before due date.
This is the problem session for the group of up to 3-4 students.
